

CYBERDISE

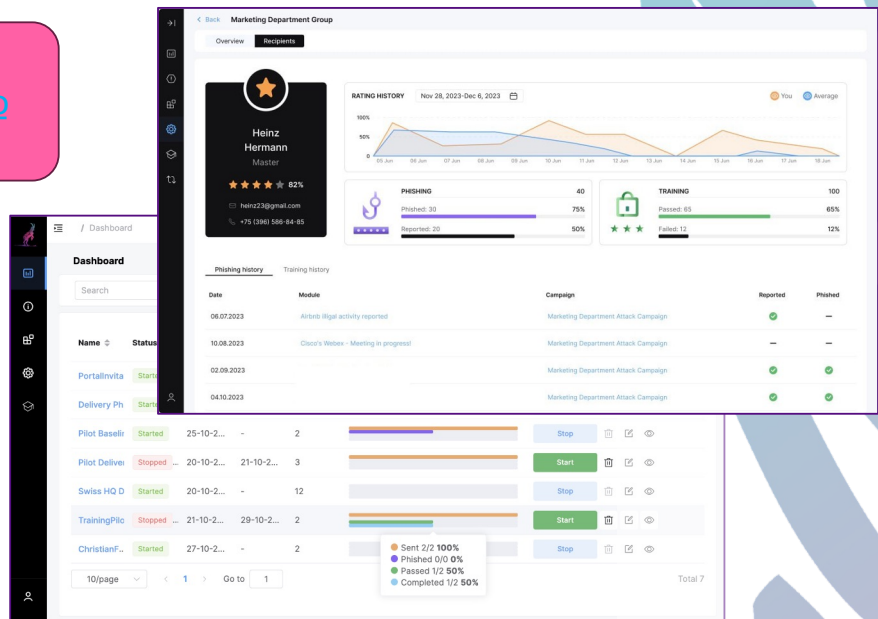

Better IT Security, AI-assisted Cybersecurity Awareness

Cyberdise is used to train employees and simulate social engineering attacks. The product is suitable for corporate customers and MSSPs. The Swiss solution provides the AI-enabled creation of campaigns or the usage of preconfigured phishing templates and training modules that can be used and adapted independently by the operator.

The "Phishing Incident Plugin for MS-Outlook© / Gmail© also gives the user the option of raising the alarm quickly in the event of an attack. The product was designed from the outset for use with the help of AI. The current version allows the creation of AI/OSINT-supported spear phishing campaigns and the cybersecurity chatbot answers the user's specific questions about corporate security. Local partners round off the offering with their services.

Please contact palo.stacho@cyberdise.io for a demo!

Already designed for NIST CSF 2.0!
